Floating Point

Introduction to Scientific Computing

Notes (unfilled, with empty boxes) About the Class Errors, Conditioning, Accuracy, Stability

What's the point of this class?

'Scientific Computing' describes a family of approaches to approximate solutions to problems once they've been state mathematically.	
Name some applications:	

What do we study, and how?

Problems with real numbers (i.e. continuous problems)	
What's the general approach?	

What makes for good numerics?

How good of an answer can we expect to our problem?
How fast can we expect the computation to complete?

Implementation concerns

How do numerical methods get implemented?					

Class web page

https://bit.ly/cs450-f21

- Assignments
 - ► HW1!
 - Pre-lecture quizzes
 - ▶ In-lecture interactive content (bring computer or phone if possible)
- Textbook
- Exams
- Class outline (with links to notes/demos/activities/quizzes)
- Discussion forum
- Policies
- Video

Programming Language: Python/numpy

- Reasonably readable
- Reasonably beginner-friendly
- ► Mainstream (top 5 in 'TIOBE Index')
- ► Free, open-source
- Great tools and libraries (not just) for scientific computing
- Python 2/3? 3!
- numpy: Provides an array datatype
 Will use this and matplotlib all the time.
- ► See class web page for learning materials

Demo: Sum the squares of the integers from 0 to 100. First without numpy, then with numpy.

Supplementary Material

- ► Numpy (from the SciPy Lectures)
- ► 100 Numpy Exercises
- ► Dive into Python3

What problems can we study in the first place?

To be able to compute a solution (through a process that introduces errors), the problem					

If it satisfies these criteria, the problem is called well-posed. Otherwise, ill-posed.

Dependency on Inputs

We excluded discontinuous problems—because we don't stand much chance for those what if the problem's input dependency is just <i>close to discontinuous</i> ?

Approximation

When does approximation happen?				

Demo: Truncation vs Rounding [cleared]

Example: Surface Area of the Earth

Compute the surface area of the earth. What parts of your computation are approximate?

Measuring Error

How do we measure error? Idea: Consider all error as being added onto the result.	

Recap: Norms

What's a norm?		
Define <i>norm</i> .		

Norms: Examples

Examples of norms?					

Demo: Vector Norms [cleared]

Norms: Which one?

Does the choice of norm really matter much?					

Norms and Errors

If we're computing a vector result, the error is a vector. That's not a very useful answer to 'how big is the error'. What can we do?	

Forward/Backward Error

Suppose want to compute $y = f(x)$, but approximate $\hat{y} = \hat{f}(x)$. What are the forward error and the backward error?	

Forward/Backward Error: Example

Suppose you wanted $y=\sqrt{2}$ and got $\hat{y}=1.4$. What's the (magnitude of) the forward error?

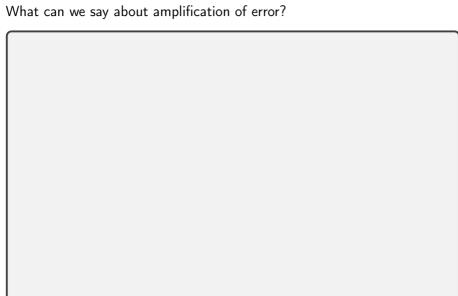

Forward/Backward Error: Example

uppose you wanted $y=\sqrt{2}$ and got $\hat{y}=1.4.$ Vhat's the (magnitude of) the backward error?					
hat's the (i	magnitude	of) the b	backward 6	error!	

Forward/Backward Error: Observations

What do you observe about the relative manitude of the relative erro	ors?

Sensitivity and Conditioning

Example: Condition Number of Evaluating a Function

y = f(x). Assume f differentiable.

Demo: Conditioning of Evaluating tan [cleared]

Stability and Accuracy

Previously: Considered <i>problems</i> or <i>questions</i> . Next: Considered <i>methods</i> , i.e. computational approaches to find solutions When is a method <i>accurate</i> ?
When is a method stable?

Getting into Trouble with Accuracy and Stability

How can I produce inacc	curate results?		
(

In-Class Activity: Forward/Backward Error

In-class activity: Forward/Backward Error

Wanted: Real Numbers... in a computer

Computers can represent integers, using bits:

$$23 = 1 \cdot 2^4 + 0 \cdot 2^3 + 1 \cdot 2^2 + 1 \cdot 2^1 + 1 \cdot 2^0 = (10111)_2$$

How would we represent fractions?

Fixed-Point Numbers

Suppose we use units of 64 bits, with 32 bits for exponents \geqslant 0 and 32 bits for exponents $<$ 0. What numbers can we represent?
How many 'digits' of relative accuracy (think relative rounding error) are available for the smallest vs. the largest number?

Floating Point Numbers

Convert $13 = (1101)_2$ into floating point representation.
What pieces do you need to store an FP number?

Floating Point: Implementation, Normalization Previously: Consider mathematical view of FP. (via example: $(1.101)_2$) Next: Consider *implementation* of FP in hardware. Do you notice a source of inefficiency in our number representation?

Unrepresentable numbers?

Can you think of a somewhat central number that we cannot represent as

$$x = (1._{---})_2 \cdot 2^{-p}$$
?

Demo: Picking apart a floating point number [cleared]

Subnormal Numbers

What is the smallest representable number in an FP system with 4 stored bits in the significand and a stored exponent range of $[-7,8]$?

Subnormal Numbers, Attempt 2

/hat is the smallest representable number in an FP system with 4 stored its in the significand and a (stored) exponent range of $[-7,8]$?
/hy learn about subnormals?

Underflow

- ► FP systems without subnormals will *underflow* (return 0) as soon as the exponent range is exhausted.
- ► This smallest representable *normal* number is called the *underflow level*, or *UFL*.
- Beyond the underflow level, subnormals provide for gradual underflow by 'keeping going' as long as there are bits in the significand, but it is important to note that subnormals don't have as many accurate digits as normal numbers.
 - Read a story on the epic battle about gradual underflow
- Analogously (but much more simply—no 'supernormals'): the overflow level, OFL.

Rounding Modes

How is rounding performed? (Imagine trying to represent π .)

$$\left(\underbrace{1.1101010}_{\text{representable}}11\right)_2$$

What is done in case of a tie? $0.5 = (0.1)_2$ ("Nearest"?)

Demo: Density of Floating Point Numbers [cleared]

Demo: Floating Point vs Program Logic [cleared]

Smallest Numbers Above...

▶ What is smallest FP number > 1? Assume 4 bits in the significand.
What's the smallest FP number > 1024 in that same system?
Can we give that number a name?

Unit Roundoff

Unit roundoff or machine precision or machine epsilon or $\varepsilon_{\rm mach}$ is the smallest number such that

$$float(1+\varepsilon) > 1.$$

▶ Technically that makes ε_{mach} depend on the rounding rule.

Assuming round-towards-infinity, in the above system, $\varepsilon_{\rm mach} = (0.00001)_2$.

- Note the extra zero.
- ▶ Another, related, quantity is *ULP*, or *unit in the last place*. $(\varepsilon_{\rm mach} = 0.5 \, \rm ULP)$

FP: Relative Rounding Error

What does calculation	about the	relative e	error incur	red in floa	ating poir	nt

FP: Machine Epsilon

What's that sa he significand)	me number for d)	ouble-precisio	n floating poi	nt? (52 bits in

Demo: Floating Point and the Harmonic Series [cleared]

In-Class Activity: Floating Point

In-class activity: Floating Point

Implementing Arithmetic

,	ented? $b = (1.001)_2 \cdot 2^{-1}$ in a	system with

Problems with FP Addition

What happens if you subtract two numbers of very similar magnitude? As an example, consider $a = (1.1011)_2 \cdot 2^0$ and $b = (1.1010)_2 \cdot 2^0$.

Demo: Catastrophic Cancellation [cleared]

Additional Topics

Solving a Linear System

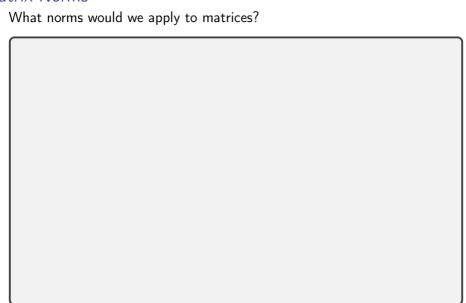

Given:

- \triangleright $m \times n$ matrix A
- \rightarrow *m*-vector **\boldsymbol{b}**

What are we looking for here, and when are we allowed to ask the question?

Next: Want to talk about conditioning of this operation. Need to measure distances of matrices.

Matrix Norms

Intuition for Matrix Norms

Provide some intuition for the matrix norm.	

Identifying Matrix Norms

Demo: Matrix norms [cleared]

Properties of Matrix Norms

Matrix norms inherit the vector norm properties:

- $||A|| > 0 \Leftrightarrow A \neq 0.$
- $ightharpoonup \|\gamma A\| = |\gamma| \|A\|$ for all scalars γ .
- ▶ Obeys triangle inequality $||A + B|| \le ||A|| + ||B||$

But also some more properties that stem from our definition:

Conditioning

/hat is th	e condit	ion nui	mber o	f solving	g a linea	r system	Ax =	b ?

Conditioning of Linear Systems: Observations

Showed $\kappa(\text{Solve } Ax = b) \le ||A^{-1}|| \, ||A||.$

I.e. found an *upper bound* on the condition number. With a little bit of fiddling, it's not too hard to find examples that achieve this bound, i.e. that it is *sharp*.

So we've found the *condition number of linear system solving*, also called the condition number of the matrix *A*:

$$cond(A) = \kappa(A) = ||A|| ||A^{-1}||.$$

Conditioning of Linear Systems: More properties

> cond is relative to a given norm. So, to be precise, use

 cond_2 or cond_∞ .

▶ If A^{-1} does not exist: $cond(A) = \infty$ by convention.

What is $\kappa(A^{-1})$?

What is the condition number of matrix-vector multiplication?

Demo: Condition number visualized [cleared]

Demo: Conditioning of 2x2 Matrices [cleared]

Residual Vector

What is the residual vector of solving the linear system

$$b = Ax$$
?

Residual and Error: Relationship

How do the (norms of the) residual vector ${m r}$ and the error $\Delta {m x} = {m x} - \widehat{{m x}}$ relate to one another?

Changing the Matrix

So far, only discussed changing the RHS, i.e. $A\mathbf{x} = \mathbf{b} \rightarrow A\hat{\mathbf{x}} = \hat{\mathbf{b}}$. The matrix consists of FP numbers, too—it, too, is approximate. I.e.

$$A\mathbf{x} = \mathbf{b} \quad \rightarrow \quad \widehat{A}\widehat{\mathbf{x}} = \mathbf{b}.$$

What can we say about the error due to an approximate matrix?

Changing Condition Numbers

Once we have a matrix A in a linear system $A\mathbf{x} = \mathbf{b}$, are we stu condition number? Or could we improve it?	ck with its
What is this called as a general concept?	

In-Class Activity: Matrix Norms and Conditioning

In-class activity: Matrix Norms and Conditioning

Singular Value Decomposition (SVD)

What is the Singular Value Decomposition of an $m \times n$ matrix?	

Computing the 2-Norm

Using the SVD of A, identify the 2-norm.	
Express the matrix condition number $cond_2(A)$ in terms of the SVD:	

Not a matrix norm: Frobenius

The 2-norm is very costly to compute. Can we make something simpler?
What about its properties?

Frobenius Norm: Properties

Is the Frobenius norm induced by any vector norm?
How does it relate to the SVD?

Solving Systems: Simple cases

Solve Dx = b if D is diagonal. (Computational cost?)

Solve Qx = b if Q is orthogonal. (Computational cost?)

Given SVD $A = U\Sigma V^T$, solve $A\mathbf{x} = \mathbf{b}$. (Computational cost?)

Solving Systems: Triangular matrices

Solve

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} & a_{14} \\ & a_{22} & a_{23} & a_{24} \\ & & a_{33} & a_{34} \\ & & & a_{44} \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ b_3 \\ b_4 \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \\ b_4 \end{bmatrix}$$

Demo: Coding back-substitution [cleared]

What about non-triangular matrices?

Gaussian Elimination

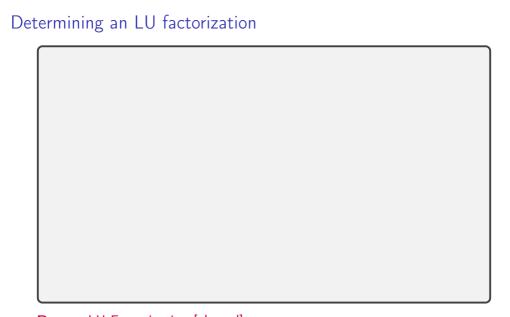

Demo: Vanilla Gaussian Elimination [cleared]
What do we get by doing Gaussian Elimination?
How is that different from being upper triangular?
What if we do not just eliminate downward but also upward?

LU Factorization

What is the LU factorization?	

Solving Ax = b

Does LU help solve $Ax = b$?		

Demo: LU Factorization [cleared]

Computational Cost

What is the computational cost of multiplying two $n \times n$ matrices?

- $\boldsymbol{\triangleright} \ u_{11} = a_{11}, \ \boldsymbol{u}_{12}^T = \boldsymbol{a}_{12}^T.$
- $ightharpoonup I_{21} = a_{21}/u_{11}.$
- $L_{22}U_{22} = A_{22} I_{21}u_{12}^T.$

What is the computational cost of carrying out LU factorization on an $n \times n$ matrix?

Demo: Complexity of Mat-Mat multiplication and LU [cleared]

LU: Failure Cases? Is LU/Gaussian Elimination bulletproof?

Saving the LU Factorization

What can be done to get something like an LU factorization?

Demo: LU Factorization with Partial Pivoting [cleared]

Cholesky: LU for Symmetric Positive Definite I U can be used for SPD matrices. But can we do better?

More cost concerns

What's the cost of solving $Ax = b$?
What's the cost of solving $A\mathbf{x} = \mathbf{b}_1, \mathbf{b}_2, \dots, \mathbf{b}_n$?
What's the cost of finding A^{-1} ?

Cost: Worrying about the Constant, BLAS

 $O(n^3)$ really means

$$\alpha \cdot n^3 + \beta \cdot n^2 + \gamma \cdot n + \delta.$$

All the non-leading and constants terms swept under the rug. But: at least the leading constant ultimately matters.

Shrinking the constant: surprisingly hard (even for 'just' matmul)

Idea: Rely on library implementation: BLAS (Fortran)

Level 1
$$\mathbf{z} = \alpha \mathbf{x} + \mathbf{y}$$
 vector-vector operations $O(n)$?axpy

Level 2
$$\mathbf{z} = A\mathbf{x} + \mathbf{y}$$
 matrix-vector operations $O(n^2)$ gemv

Level 3
$$C = AB + \beta C$$
 matrix-matrix operations $O(n^3)$

?gemm. ?trsm

Show (using perf): numpy matmul calls BLAS dgemm

LAPACK

LAPACK: Implements 'higher-end' things (such as LU) using BLAS Special matrix formats can also help save const significantly, e.g.

- banded
- sparse
- symmetric
- triangular

Sample routine names:

- dgesvd, zgesdd
- ▶ dgetrf, dgetrs

LU on Blocks: The Schur Complement

Given a matrix	$\begin{bmatrix} A & B \\ C & D \end{bmatrix}$,
can we do 'block LU' to get a blo	ock triangular matrix?

LU: Special cases

What happens if we feed a non-invertible matrix to LU?	
What happens if we feed LU an $m \times n$ non-square matrices?	

Round-off Error in LU without Pivoting

Consider factorization of $\begin{bmatrix} \epsilon \\ 1 \end{bmatrix}$	$\begin{bmatrix} 1 \\ 1 \end{bmatrix}$ where $\epsilon < \epsilon_{\sf mach}$:

Round-off Error in LU with Pivoting

Permuting the rows of A in partial pivoting gives $PA = egin{bmatrix} 1 \\ \epsilon \end{bmatrix}$	1 1

Changing matrices

eap to re-solve actorization) V	- ,	pensive

Demo: Sherman-Morrison [cleared]

Additional Topics

What about non-square systems?

Specifically, what about linear systems with 'tall and skinny' matrices? (A: $m \times n$ with m > n) (aka overdetermined linear systems)

Specifically, any hope that we will solve those exactly?

Example: Data Fitting

Have data: (x_i, y_i) and model:

$$y(x) = \alpha + \beta x + \gamma x^2$$

Find data that (best) fit model!

Data Fitting Continued

Rewriting Data Fitting

Least Squares: The Problem In Matrix Form

$$\|A\mathbf{x} - \mathbf{b}\|_2^2 \rightarrow \min!$$

is cumbersome to write.

Invent new notation, defined to be equivalent:

$$Ax \cong b$$

NOTE:

- ▶ Data Fitting is *one example* where LSQ problems arise.
- ▶ Many other application lead to $Ax \cong b$, with different matrices.

Data Fitting: Nonlinearity

Give an example of a nonlinear data fitting problem.

$$\left| \exp(\alpha) + \beta x_1 + \gamma x_1^2 - y_1 \right|^2 + \dots + \left| \exp(\alpha) + \beta x_n + \gamma x_n^2 - y_n \right|^2 \rightarrow \text{min!}$$

But that would be easy to remedy: Do linear least squares with $\exp(\alpha)$ as the unknown. More difficult:

$$\begin{vmatrix} \alpha + \exp(\beta x_1 + \gamma x_1^2) - y_1 \end{vmatrix}^2 + \dots + \\ \begin{vmatrix} \alpha + \exp(\beta x_n + \gamma x_n^2) - y_n \end{vmatrix}^2 \rightarrow \min!$$

Demo: Interactive Polynomial Fit [cleared]

Properties of Least-Squares

Consider LSQ problem $A\mathbf{x} \cong \mathbf{b}$ and its associated <i>objective function</i> $\varphi(\mathbf{x}) = \ \mathbf{b} - A\mathbf{x}\ _2^2$. Assume A has full rank. Does this always have a solution?	
Is it always unique?	

Least-Squares: Finding a Solution by Minimization

Examine the objective function, find its minimum.	

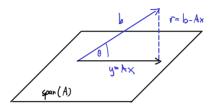

Least squares: Demos

Demo: Polynomial fitting with the normal equations [cleared]

What's the shape of A^TA ?

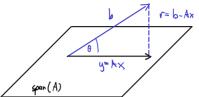

Demo: Issues with the normal equations [cleared]

Least Squares, Viewed Geometrically

Why is $r \perp \text{span}(A)$ a good thing to require?

Least Squares, Viewed Geometrically (II)

Phrase the Pythagoras observation as an equation.

Write that with an orthogonal projection matrix P.

About Orthogonal Projectors

What is a projector?
What is an orthogonal projector?
How do I make one projecting onto span $\{m{q}_1,m{q}_2,\ldots,m{q}_\ell\}$ for orthogonal $m{q}_i$

Least Squares and Orthogonal Projection

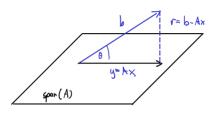

Pseudoinverse

What is the pseudoinverse of A?
What can we say about the condition number in the case of a tall-and-skinny, full-rank matrix?
What does all this have to do with solving least squares problems?

In-Class Activity: Least Squares

In-class activity: Least Squares

Sensitivity and Conditioning of Least Squares

Relate ||Ax|| and **b** with $\$\theta$ via trig functions.

Sensitivity and Conditioning of Least Squares (III)

Any comments regarding dependencies?
What about changes in the matrix?

Recap: Orthogonal Matrices

What's an orthogonal (=orthonormal) matrix?

One that satisfies
$$Q^TQ = I$$
 and $QQ^T = I$.

How do orthogonal matrices interact with the 2-norm?

$$\|Q\mathbf{v}\|_2^2 = (Q\mathbf{v})^T(Q\mathbf{v}) = \mathbf{v}^TQ^TQ\mathbf{v} = \mathbf{v}^T\mathbf{v} = \|\mathbf{v}\|_2^2.$$

Transforming Least Squares to Upper Triangular

Suppose we have $A = QR$, with Q square and orthogonal, and R upper triangular. This is called a QR factorization. How do we transform the least squares problem $Ax \cong b$ to one with an upper triangular matrix?

Simpler Problems: Triangular

What do we win from transforming a least-squares system to upper triangular form?					
d we minin	nize the resi	idual norm	?		
				d we minimize the residual norm?	

Computing QR

- ► Gram-Schmidt
- Householder Reflectors
- Givens Rotations

Demo: Gram-Schmidt-The Movie [cleared]

Demo: Gram-Schmidt and Modified Gram-Schmidt [cleared] **Demo:** Keeping track of coefficients in Gram-Schmidt [cleared]

Seen: Even modified Gram-Schmidt still unsatisfactory in finite precision arithmetic because of roundoff.

NOTE: Textbook makes further modification to 'modified' Gram-Schmidt:

- Orthogonalize subsequent rather than preceding vectors.
- Numerically: no difference, but sometimes algorithmically helpful.

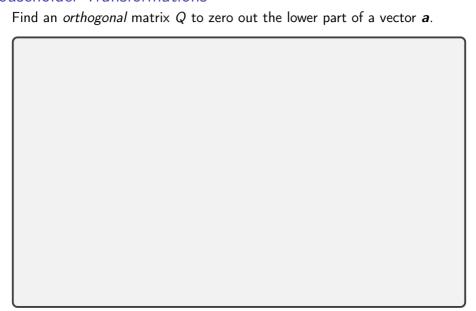

Economical/Reduced QR

Is QR with square	$e\ Q\ ext{for}\ A\in\mathbb{R}^{m imes n}\ ext{with}\ m>n\ ext{efficient?}$	

In-Class Activity: QR

In-class activity: QR

Householder Transformations

Householder Reflectors: Properties

Seen from picture (and easy to see with algebra):

$$H\mathbf{a} = \pm \|\mathbf{a}\|_2 \mathbf{e}_1.$$

Remarks:

- ▶ Q: What if we want to zero out only the i + 1th through nth entry? A: Use e_i above.
- A product $H_n \cdots H_1 A = R$ of Householders makes it easy (and quite efficient!) to build a QR factorization.
- ▶ It turns out $\mathbf{v}' = \mathbf{a} + \|\mathbf{a}\|_2 \mathbf{e}_1$ works out, too-just pick whichever one causes less cancellation.
- H is symmetric
- H is orthogonal

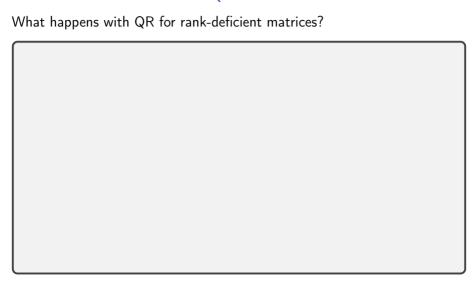

Demo: 3x3 Householder demo [cleared]

Givens Rotations

Demo: 3x3 Givens demo [cleared]

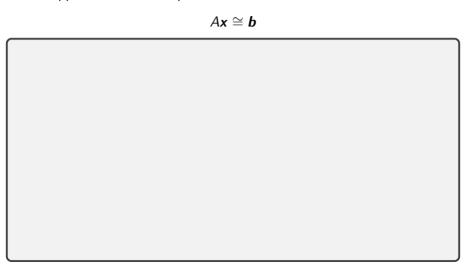

f reflections work, can we make rotations work, too?	

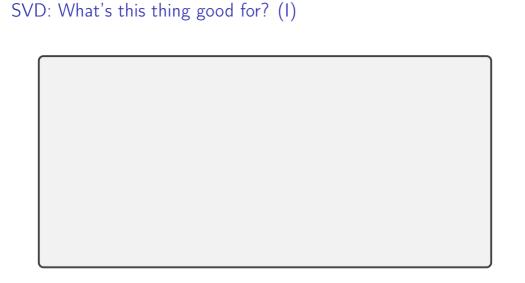

Rank-Deficient Matrices and QR

Rank-Deficient Matrices and Least-Squares

What happens with Least Squares for rank-deficient matrices?

SVD: What's this thing good for? (II)

► Low-rank Approximation

Theorem (Eckart-Young-Mirsky)

If k < r = rank(A) and

$$A_k = \sum_{i=1}^k \sigma_i u_i v_i^T$$
, then

$$\min_{\mathsf{rank}(B)=k} \|A - B\|_2 = \|A - A_k\|_2 = \sigma_{k+1},$$

$$\min_{\mathsf{rank}(B)=k} \|A - B\|_F = \|A - A_k\|_F = \sqrt{\sum_{j=k}^n \sigma_j^2}.$$

SVD: What's this thing good for? (III)

▶ The minimum norm solution to $Ax \cong b$:

SVD: Minimum-Norm, Pseudoinverse

What is the minimum 2-norm solution to $Ax \cong b$ and why?
Generalize the pseudoinverse to the case of a rank-deficient matrix.

Initial Value Problems for ODEs

Boundary Value Problems for ODE

Partial Differential Equations and Sparse Linear Algebra

Fast Fourier Transform

Additional Topics

Eigenvalue Problems: Setup/Math Recap

A is an $n \times n$ matrix.

 $x \neq 0$ is called an *eigenvector* of A if there exists a λ so that

$$A\mathbf{x} = \lambda \mathbf{x}$$
.

- ▶ In that case, λ is called an *eigenvalue*.
- ▶ The set of all eigenvalues $\lambda(A)$ is called the *spectrum*.
- ▶ The *spectral radius* is the magnitude of the biggest eigenvalue:

$$\rho(A) = \max\{|\lambda| : \lambda(A)\}$$

Finding Eigenvalues

How do you find eigenvalues?

$$A\mathbf{x} = \lambda \mathbf{x} \Leftrightarrow (A - \lambda I)\mathbf{x} = 0$$

$$\Leftrightarrow A - \lambda I \text{ singular } \Leftrightarrow \det(A - \lambda I) = 0$$

 $det(A - \lambda I)$ is called the *characteristic polynomial*, which has degree n, and therefore n (potentially complex) roots.

Does that help algorithmically? Abel-Ruffini theorem: for $n \ge 5$ is no general formula for roots of polynomial. IOW: no.

- ► For LU and QR, we obtain *exact* answers (except rounding).
- For eigenvalue problems: not possible—must approximate.

Demo: Rounding in characteristic polynomial using SymPy [cleared]

Multiplicity

What is the *multiplicity* of an eigenvalue?

Actually, there are two notions called multiplicity:

- ► Algebraic Multiplicity: multiplicity of the root of the characteristic polynomial
- ► Geometric Multiplicity: #of lin. indep. eigenvectors

In general: $AM \geqslant GM$.

If AM > GM, the matrix is called *defective*.

An Example

Give characteristic polynomial, eigenvalues, eigenvectors of

$$\begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}.$$

Diagonalizability

When is a matrix called diagonalizable?	

Similar Matrices

Related definition: Two matrices A and B are called similar if there exists an invertible matrix X so that $A = XBX^{-1}$.
In that sense: "Diagonalizable" = "Similar to a diagonal matrix".
Observe: Similar A and B have same eigenvalues. (Why?)

Eigenvalue Transformations (I)

What do the following transformations of the eigenvalue problem $A\mathbf{x}=\lambda\mathbf{x}$ do? Shift. $A\to A-\sigma I$
Inversion. $A o A^{-1}$
Power. $A \rightarrow A^k$

Eigenvalue Transformations (II)

Polynomial $A o aA^2 + bA + cI$	
Similarity $T^{-1}AT$ with T invertible	

Sensitivity (I)

Assume A not defective. Suppose $X^{-1}AX = D$. Perturb $A \to A + E$. What happens to the eigenvalues?

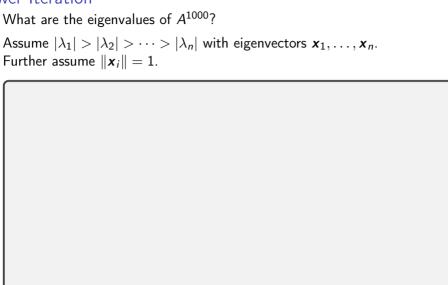

Sensitivity (II)

$$X^{-1}(A+E)X = D+F$$
. Have $\|(\mu I - D)^{-1}\|^{-1} \le \|F\|$.

Demo: Bauer-Fike Eigenvalue Sensitivity Bound [cleared]

Power Iteration

Power Iteration: Issues?

What could g	o wrong wit	th Power Ite	eration?	

What about Eigenvalues?

Power Iteration generates eigenvectors. What if we would like to know eigenvalues?

Convergence of Power Iteration

What can you say about the convergence of the power method? Say $\mathbf{v}_1^{(k)}$ is the kth estimate of the eigenvector \mathbf{x}_1 , and

$$e_k = \left\| oldsymbol{x}_1 - oldsymbol{v}_1^{(k)}
ight\|.$$

Inverse Iteration

Describe inverse iteration.	

Rayleigh Quotient Iteration

Describe Rayleigh Quotient	Iteration.	

Demo: Power Iteration and its Variants [cleared]

In-Class Activity: Eigenvalues

In-class activity: Eigenvalues

Schur form

Show: Every matrix is orthonormally similar to an upper triangular matrix, i.e. $A = QUQ^T$. This is called the Schur form or Schur factorization.

Schur Form: Comments, Eigenvalues, Eigenvectors

- $A = QUQ^T$. For complex λ :
 - ► Either complex matrices, or
 - \triangleright 2 × 2 blocks on diag.

If we had a Schur form of A, how can we find the eigenvalues?

And the eigenvectors?		

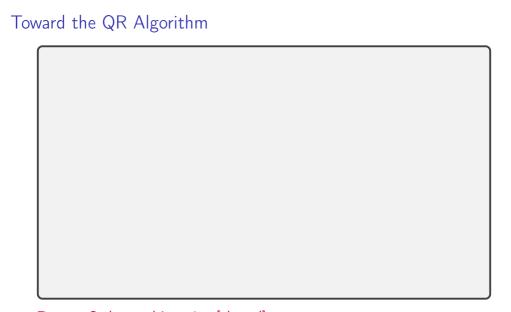

Computing Multiple Eigenvalues

All Power Iteration Methods compute one eigenvalue at a time. What if I want <i>all</i> eigenvalues?	

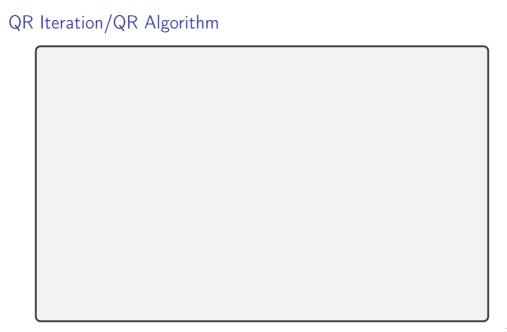

Simultaneous Iteration

What happens if we carry out power iteration on multiple vectors multaneously?	

Orthogonal Iteration

Demo: Orthogonal Iteration [cleared]

QR Iteration: Incorporating a Shift How can we accelerate convergence of QR iteration using shifts?

QR Iteration: Computational Expense

A full QR factorization at each iteration costs $O(n^3)$ -can we make that cheaper?

Demo: Householder Similarity Transforms [cleared]

QR/Hessenberg: Overall procedure

Overal	proced	ا بـ م .
Overai	i brocea	iure:

- 1. Reduce matrix to Hessenberg form

Apply QR iteration using Givens QR to obtain Schur form
y does QR iteration <i>stay</i> in Hessenberg form?
at does this process look like for symmetric matrices?

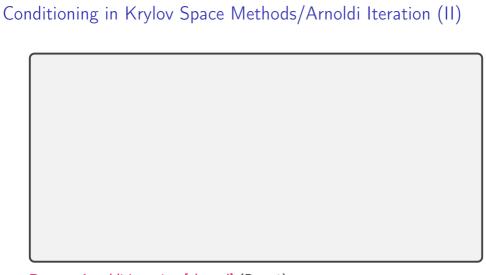

Krylov space methods: Intro

What subspaces can we use to look for eigenvectors?						

Krylov for Matrix Factorization

What matrix factorization is obtained through Krylov space methods?						

Conditioning in Krylov Space Methods/Arnoldi Iteration (I) What is a problem with Krylov space methods? How can we fix it?

Demo: Arnoldi Iteration [cleared] (Part 1)

Krylov: What about eigenvalues? How can we use Arnoldi/Lanczos to compute eigenvalues?

Computing the SVD (Kiddy Version)

Demo: Computing the SVD [cleared]

"Actual"/"non-kiddy" computation of the SVD:

- ▶ Bidiagonalize $A = U \begin{bmatrix} B \\ 0 \end{bmatrix} V^T$, then diagonalize via variant of QR.
- ▶ References: Chan '82 or Golub/van Loan Sec 8.6.

Optimization: Problem Statement

Have: Objective function $f: \mathbb{R}^n \to \mathbb{R}$ *Want:* Minimizer $\mathbf{x}^* \in \mathbb{R}^n$ so that

$$f(\mathbf{x}^*) = \min_{\mathbf{x}} f(\mathbf{x})$$
 subject to $\mathbf{g}(\mathbf{x}) = 0$ and $\mathbf{h}(\mathbf{x}) \leq 0$.

- ▶ g(x) = 0 and $h(x) \le 0$ are called constraints. They define the set of feasible points $x \in S \subseteq \mathbb{R}^n$.
- ► If **g** or **h** are present, this is constrained optimization. Otherwise unconstrained optimization.
- ▶ If **f**, **g**, **h** are *linear*, this is called *linear* programming. Otherwise nonlinear programming.

Optimization: Observations Q: What if we are looking for a maximizer not a minimizer? Give some examples: What about multiple objectives?

Existence/Uniqueness

Terminology: global minimum / local minimum
Under what conditions on f can we say something about existence/uniqueness?
If $f:S o\mathbb{R}$ is continuous on a closed and bounded set $S\subseteq\mathbb{R}^n$, then
$f:S o\mathbb{R}$ is called <i>coercive</i> on $S\subseteq\mathbb{R}^n$ (which must be unbounded) if
If f is coercive,

Convexity

$$S \subseteq \mathbb{R}^n$$
 is called convex if for all $\pmb{x}, \pmb{y} \in S$ and all $0 \le \alpha \le 1$

 $f: S \to \mathbb{R}$ is called convex on $S \subseteq \mathbb{R}^n$ if for $x, y \in S$ and all $0 \le \alpha \le 1$

Q: Give an example of a convex, but not strictly convex function.

Convexity: Consequences

f f is convex,	
f f is strictly convex,	

Optimality Conditions

Optimization: Observations

Q: Come up with a hypothetical approach for finding minima.
Q: Is the Hessian symmetric?
Q: How can we practically test for positive definiteness?

Sensitivity and Conditioning (1D)

How does optimization react to a slight perturbation of the minimum?			

Sensitivity and Conditioning (nD)

How does optimization react to a slight perturbation of the minimum?				

Unimodality

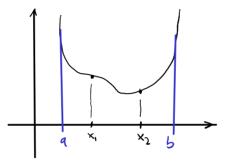

Would like a method like bisection, but for optimization. In general: No invariant that can be preserved. Need <i>extra assumption</i> .

Idea:		

Newton's method (n D)

What does Newton's method look like in <i>n</i> dimensions?			

Newton's method (n D): Observations

Demo: Newton's method in n dimensions [cleared]

Drawbacks?			

Quasi-Newton Methods

Secant/Broyden-type ideas carry over to optimization. How?

BFGS: Secant-type method, similar to Broyden:

$$\boldsymbol{B}_{k+1} = \boldsymbol{B}_k + \frac{\boldsymbol{y}_k \boldsymbol{y}_k^T}{\boldsymbol{y}_k^T \boldsymbol{s}_k} - \frac{\boldsymbol{B}_k \boldsymbol{s}_k \boldsymbol{s}_k^T \boldsymbol{B}_k}{\boldsymbol{s}_k^T \boldsymbol{B}_k \boldsymbol{s}_k}$$

where

$$ightharpoonup s_k = \mathbf{x}_{k+1} - \mathbf{x}_k$$

In-Class Activity: Optimization Methods

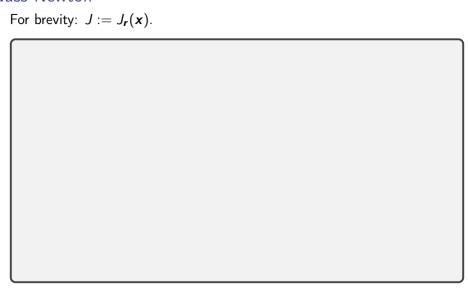

In-class activity: Optimization Methods

Nonlinear Least Squares: Setup

What if the f to be minimized is actually a 2-norm?

$$f(\mathbf{x}) = \|\mathbf{r}(\mathbf{x})\|_2$$
, $\mathbf{r}(\mathbf{x}) = \mathbf{y} - \mathbf{a}(\mathbf{x})$

Gauss-Newton

Gauss-Newton: Observations?

Demo: Gauss-Newton [cleared]
Observations?

$Levenberg\hbox{-}Marquardt$

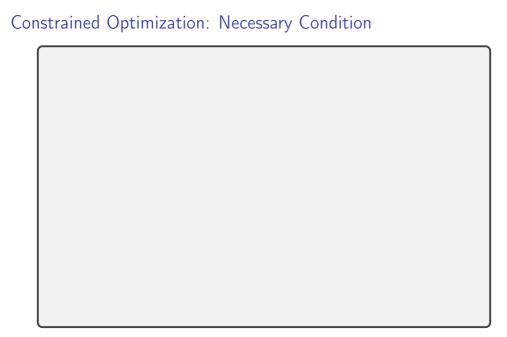

If Gauss-Newton on its own is poorly, conditioned, can try Levenberg-Marquardt:				

Constrained Optimization: Problem Setup

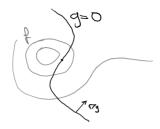

Want x^* so that

$$f(\mathbf{x}^*) = \min_{\mathbf{x}} f(\mathbf{x})$$
 subject to $\mathbf{g}(\mathbf{x}) = 0$

No inequality constraints just yet. This is *equality-constrained* optimization. Develop a (local) necessary condition for a minimum.

Lagrange Multipliers

Seen: Need $-\nabla f(\mathbf{x}) = J_{\mathbf{x}}^T \lambda$ at the (constrained) optimum.

Idea: Turn constrained optimization problem for x into an unconstrained optimization problem for (x, λ) . How?

Lagrange Multipliers: Development

$$\mathcal{L}(m{x},m{\lambda}) := f(m{x}) + m{\lambda}^Tm{g}(m{x}).$$

Demo: Sequential Quadratic Programming [cleared]

Inequality-Constrained Optimization

Want x^* so that

$$f(\mathbf{x}^*) = \min_{\mathbf{x}} f(\mathbf{x})$$
 subject to $\mathbf{g}(\mathbf{x}) = 0$ and $\mathbf{h}(\mathbf{x}) \leq 0$.

Develop a necessary condition for a minimum.

Lagrangian, Active/Inactive

Put together the overall Lagrangian.				
What are active and inactive constraints?				

${\sf Karush\text{-}Kuhn\text{-}Tucker}\;\big(\mathsf{KKT}\big)\;\mathsf{Conditions}$

Develop a set of necessary conditions for a minimum.

Additional Topics

Interpolation: Setup

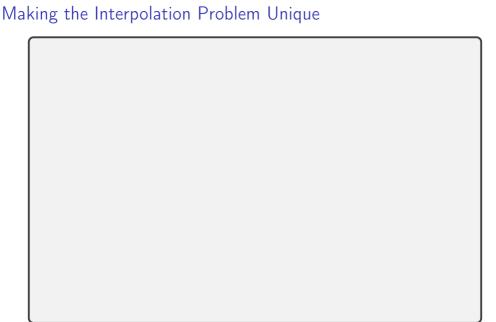

Given: $(x_i)_{i=1}^N$, $(y_i)_{i=1}^N$ Wanted: Function f so that $f(x_i) = y_i$					
How is this not the same as function fitting? (from least squares)					

Interpolation: Setup (II)

Given: $(x_i)_{i=1}^N$, $(y_i)_{i=1}^N$ Wanted: Function f so that $f(x_i) = y_i$ Does this problem have a unique answer?

Interpolation: Importance

Why is interpolation important?					

Existence/Sensitivity

Solution to the interpolation problem: Existence? Uniqueness?
Sensitivity?

Modes and Nodes (aka Functions and Points)

Both function basis and point set are under our control. What do we pick?

Ideas for basis functions:

- ightharpoonup Monomials $1, x, x^2, x^3, x^4, \dots$
- Functions that make V=I
 ightarrow 'Lagrange basis'
- Functions that make V triangular → 'Newton basis'
- Splines (piecewise polynomials)
- Orthogonal polynomials
- Sines and cosines
- ► 'Bumps' ('Radial Basis Functions')

Ideas for points:

- Equispaced
- ► 'Edge-Clustered' (so-called Chebyshev/Gauss/... nodes)

Specific issues:

- Why not monomials on equispaced points?
 - **Demo:** Monomial interpolation [cleared]
- Why not equispaced?
 Demo: Choice of Nodes for
 Polynomial Interpolation
 [cleared]

Lagrange Interpolation

Find a basis so that V = I, i.e.

$$arphi_j(x_i) = egin{cases} 1 & i = j, \ 0 & ext{otherwise}. \end{cases}$$

Lagrange Polynomials: General Form

$$\varphi_j(x) = \frac{\prod_{k=1, k \neq j}^m (x - x_k)}{\prod_{k=1, k \neq j}^m (x_j - x_k)}$$

Write down the Lagrange interpolant for nodes $(x_i)_{i=1}^m$ and values $(y_i)_{i=1}^m$.

Newton Interpolation

ind a basis so that V is triangular.	
Vhy not Lagrange/Newton?	

Better conditioning: Orthogonal polynomials

What caused monomials to have a terribly conditioned Vandermonde?	
What's a way to make sure two vectors are <i>not</i> like that?	
But polynomials are functions!	

Orthogonality of Functions

How can functions be orthogonal?	

Constructing Orthogonal Polynomials

Chebyshev Polynomials: Definitions

Three equivalent definitions:

▶ Result of Gram-Schmidt with weight $1/\sqrt{1-x^2}$. What is that weight?

(Like for Legendre, you won't exactly get the standard normalization if you do this.)

- $T_k(x) = \cos(k\cos^{-1}(x))$
- $ightharpoonup T_k(x) = 2xT_{k-1}(x) T_{k-2}(x)$ plus $T_0 = 1$, $T_0 = x$

Chebyshev Interpolation

What is the Vandermonde matrix for Chebyshev polynomials?

Chebyshev Nodes

Might also consider roots (instead of extrema) of T_k :

$$x_i = \cos\left(\frac{2i-1}{2k}\pi\right) \quad (i=1\ldots,k).$$

Vandermonde for these (with T_k) can be applied in $O(N \log N)$ time, too.

Edge-clustering seemed like a good thing in interpolation nodes. Do these do that?

Demo: Chebyshev Interpolation [cleared] (Part I-IV)

Chebyshev Interpolation: Summary

- Chebyshev interpolation is fast and works extremely well
- ▶ http://www.chebfun.org/ and: ATAP
- ▶ In 1D, they're a very good answer to the interpolation question
- But sometimes a piecewise approximation (with a specifiable level of smoothness) is more suited to the application

In-Class Activity: Interpolation

In-class activity: Interpolation

Truncation Error in Interpolation

If f is n times continuously differentiable on a closed interval I and $p_{n-1}(x)$ is a polynomial of degree at most n that interpolates f at n distinct points $\{x_i\}$ (i=1,...,n) in that interval, then for each x in the interval there exists ξ in that interval such that

$$f(x) - p_{n-1}(x) = \frac{f^{(n)}(\xi)}{n!}(x - x_1)(x - x_2) \cdots (x - x_n).$$

Truncation Error in Interpolation: cont'd.

$$Y_x(t) = R(t) - \frac{R(x)}{W(x)}W(t)$$
 where $W(t) = \prod_{i=1}^n (t - x_i)$

Error Result: Connection to Chebyshev

What is the connection between the error result and Chebyshev interpolation?					

Demo: Chebyshev Interpolation [cleared] (Part V)

Error Result: Simplified Form

Boil the error result down to a simpler form.

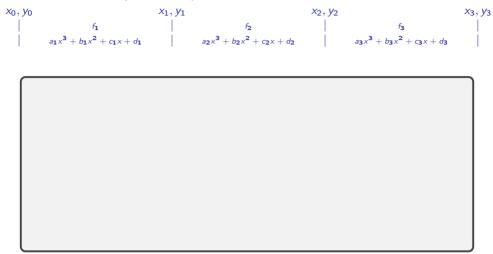

- ▶ Demo: Interpolation Error [cleared]

Going piecewise: Simplest Case

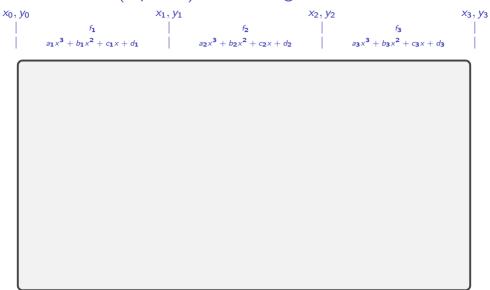

Construct a pieceweise linear interpolant at four points.

Why three intervals?

Piecewise Cubic ('Splines')

Piecewise Cubic ('Splines'): Accounting

Outline

Numerical Integration and Differentiation Numerical Integration Quadrature Methods Accuracy and Stability Gaussian Quadrature Composite Quadrature Numerical Differentiation Richardson Extrapolation

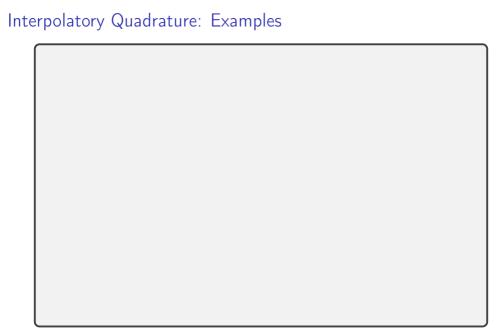

Numerical Integration: About the Problem

What is numerical integration? (Or quadrature?)				
What about existence and uniqueness?				

Conditioning

Derive the (absolute) condition number for numerical integration.					

Interpolatory Quadrature Design a quadrature method based on interpolation.

Interpolatory Quadrature: Computing Weights How do the weights in interpolatory quadrature get computed?

Demo: Newton-Cotes weight finder [cleared]

Examples and Exactness

To what polynomial degree are the following rules exact?

Midpoint rule
$$(b-a)f(\frac{a+b}{2})$$

Trapezoidal rule
$$\frac{b-a}{2}(f(a)+f(b))$$

Simpson's rule
$$\frac{b-a}{6}\left(f(a)+4f\left(\frac{a+b}{2}\right)+f(b)\right)$$

Interpolatory Quadrature: Accuracy

Let p_{n-1} be an interpolant of f at nodes x_1, \ldots, x_n (of degree n-1) Recall

$$\sum_{i} \omega_{i} f(x_{i}) = \int_{a}^{b} p_{n-1}(x) dx.$$

What can you say about the accuracy of the method?

Quadrature: Overview of Rules

7	daratare. Overview or realist						
		n	Deg.	Ex.Int.Deg.	Intp.Ord.	Quad.Ord.	Quad.Ord.
				(w/odd) (regular) ((w/odd)	
			n-1	$(n-1)+1_{odd}$	n	n+1	$(n+1)+1_{odd}$
	Midp.	1	0	1	1	2	3
	Trapz.	2	1	1	2	3	3
	Simps.	3	2	3	3	4	5
	S. 3/8	4	3	3	4	5	5

- n: number of points
- ▶ "Deg.": Degree of polynomial used in interpolation (= n 1)
- "Ex.Int.Deg.": Polynomials of up to (and including) this degree actually get integrated exactly. (including the odd-order bump)
- "Intp.Ord.": Order of Accuracy of Interpolation: $O(h^n)$
- "Quad.Ord. (regular)": Order of accuracy for quadrature predicted by the error result above: $O(h^{n+1})$
- "Quad.Ord. (w/odd):" Actual order of accuracy for quadrature given 'bonus' degrees for rules with odd point count

Observation: Quadrature gets (at least) 'one order higher' than interpolation-even more for odd-order rules. (i.e. more accurate)

Interpolatory Quadrature: Stability

Let p_n be an interpolant of f at nodes x_1, \ldots, x_n (of degree n-1) Recall

$$\sum_{i} \omega_{i} f(x_{i}) = \int_{a}^{b} p_{n}(x) \mathrm{d}x$$

What can you say about the stability of this method?

So, what quadrature weights make for bad stability bounds?

About Newton-Cotes

		quadrature? <mark>ared]</mark> (again	y nodes)

Gaussian Quadrature

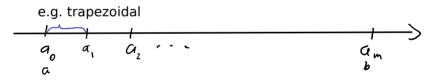

So far: nodes chosen from outside. Can we gain something if we let the quadrature rule choose the nodes, too? Hope: More design freedom \rightarrow Exact to higher degree.

Demo: Gaussian quadrature weight finder [cleared]

Composite Quadrature

High-order polynomial interpolation requires a high degree of smoothness of the function.

Idea: Stitch together multiple lower-order quadrature rules to alleviate smoothness requirement.

Error in Composite Quadrature

What can we say about the error in the case of composite quadrature?									

Composite Quadrature: Notes

Observation: Composite quadrature loses an order compared to non-composite.

Idea: If we can estimate errors on each subinterval, we can shrink (e.g. by splitting in half) only those contributing the most to the error. (adaptivity, \rightarrow hw)

Taking Derivatives Numerically

Why shouldn't you take derivatives numerically?					

Numerical Differentiation: How? How can we take derivatives numerically?

Demo: Taking Derivatives with Vandermonde Matrices [cleared] (Basics)

Numerical Differentiation: Accuracy

How accurate is numerical differentiation (with a polynomial basis)?					

Demo: Taking Derivatives with Vandermonde Matrices [cleared] (Accuracy)

Differentiation Matrices

How can numerical differentiation be cast as a matrix-vector operation?						

Demo: Taking Derivatives with Vandermonde Matrices [cleared] (Build D)

Properties of Differentiation Matrices

How do I find second derivatives?
Does D have a nullspace?

Numerical Differentiation: Shift and Scale

Does D change if we shift the nodes $(x_i)_{i=1}^n \to (x_i + c)_{i=1}^n$? Does D change if we scale the nodes $(x_i)_{i=1}^n \to (\alpha x_i)_{i=1}^n$?

Finite Difference Formulas from Diff. Matrices

How do the rows of a differentiation matrix relate to FD formulas?
Assume a large equispaced grid and 3 nodes w/same spacing. How to use?

More Finite Difference Rules

Similarly:

$$f'(x) = \frac{f(x+h) - f(x-h)}{2h} + O(h^2)$$

(Centered differences)

Can also take higher order derivatives:

$$f''(x) = \frac{f(x+h) - 2f(x) + f(x-h)}{h^2} + O(h^2)$$

Can find these by trying to match Taylor terms.

Alternative: Use linear algebra with interpolate-then-differentiate to find FD formulas.

Demo: Finite Differences vs Noise [cleared]

Demo: Floating point vs Finite Differences [cleared]

Richardson Extrapolation

Deriving high-order methods is hard work. Can I just do multiple low-order approximations (with different h and get a high-order one out?

Suppose we have $F = \tilde{F}(h) + O(h^p)$ and $\tilde{F}(h_1)$ and $\tilde{F}(h_2)$.

Richardson Extrapolation: Observations,

What are α and β for a first-order (e.g. finite-difference) method if we choose $h_2=h_1/2$?

Demo: Richardson with Finite Differences [cleared]

Romberg Integration

Can this be	Can this be used to get even higher order accuracy?				

In-Class Activity: Differentiation and Quadrature

In-class activity: Differentiation and Quadrature

Outline

Initial Value Problems for ODEs Existence, Uniqueness, Conditioning Numerical Methods (I) Accuracy and Stability Stiffness Numerical Methods (II)

What can we solve already?

- ► Linear Systems: yes
- ► Nonlinear systems: yes
- Systems with derivatives: no

Some Applications

IVPs	BVPs
 Population dynamics y'₁ = y₁(α₁ − β₁y₂) (prey) y'₂ = y₂(−α₂ + β₂y₁) (predator) chemical reactions equations of motion 	 bridge load pollutant concentration (steady state) temperature (steady state) waves (time-harmonic)

Demo: Predator-Prey System [cleared]

Initial Value Problems: Problem Statement

Want: Function $\mathbf{y}:[0,T]\to\mathbb{R}^n$ so that

- $y^{(k)}(t) = f(t, y, y', y'', \dots, y^{(k-1)})$ (explicit), or
- $f(t, \mathbf{y}, \mathbf{y}', \mathbf{y}'', \dots, \mathbf{y}^{(k)}) = 0 \quad (implicit)$

are called explicit/implicit *kth-order ordinary differential equations* (*ODEs*). Give a simple example.

Not uniquely solvable on its own. What else is needed?	

Reducing ODEs to First-Order Form

A kth	order	ODE	can	always	be	reduced	to	first	order.	Do	this	in	this
examp	le:												

$$y''(t) = f(y)$$

Properties of ODEs

What is a linear ODE?
What is a linear and homogeneous ODE?
What is a constant-coefficient ODE?

Properties of ODEs (II)

What is an autonomous ODE?					

Existence and Uniqueness

Consider the perturbed problem

$$\begin{cases} \mathbf{y}'(t) = \mathbf{f}(\mathbf{y}) \\ \mathbf{y}(t_0) = \mathbf{y}_0 \end{cases} \begin{cases} \widehat{\mathbf{y}}'(t) = \mathbf{f}(\widehat{\mathbf{y}}) \\ \widehat{\mathbf{y}}(t_0) = \widehat{\mathbf{y}}_0 \end{cases}$$

Then if f is Lipschitz continuous (has 'bounded slope'), i.e.

$$\|\mathbf{f}(\mathbf{y}) - \mathbf{f}(\widehat{\mathbf{y}})\| \le L \|\mathbf{y} - \widehat{\mathbf{y}}\|$$

(where L is called the Lipschitz constant), then...

What does this mean for uniqueness?

Conditioning

Unfortunate terminology accident: "Stability" in ODE-speak

To adapt to conventional terminology, we will use 'Stability' for

- ▶ the conditioning of the IVP, and
- ▶ the stability of the methods we cook up.

Some terminology:

An ODE is stable if and only if...

An ODE is asymptotically stable if and only if

Example I: Scalar, Constant-Coefficient

$$\left\{ \begin{array}{l} y'(t) = \lambda y \\ y(0) = y_0 \end{array} \right. \quad \text{where} \quad \lambda = a + ib$$

Solution?

)

When is this stable?

Example II: Constant-Coefficient System

$$\begin{cases} \mathbf{y}'(t) = A\mathbf{y}(t) \\ \mathbf{y}(t_0) = \mathbf{y}_0 \end{cases}$$

Assume $V^{-1} \, \mathsf{AV} = D = \mathsf{diag}(\lambda_1, \dots, \lambda_n)$ diagonal. Find a solution.

When is this stable?

Euler's Method

Discretize the IVP

$$\begin{cases} \mathbf{y}'(t) = \mathbf{f}(\mathbf{y}) \\ \mathbf{y}(t_0) = \mathbf{y}_0 \end{cases}$$

- ▶ Discrete times: $t_1, t_2, ...,$ with $t_{i+1} = t_i + h$
- ▶ Discrete function values: $\mathbf{y}_k \approx \mathbf{y}(t_k)$.

Euler's method: Forward and Backward

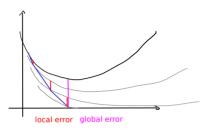

$$\mathbf{y}(t) = \mathbf{y}_0 + \int_{t_0}^t \mathbf{f}(\mathbf{y}(\tau)) d\tau,$$

Use 'left rectangle rule' on integral:

Use 'right rectangle rule' on integral:

Demo: Forward Euler stability [cleared]

Global and Local Error

Let $u_k(t)$ be the function that solves the ODE with the initial condition $u_k(t_k) = y_k$. Define the local error at step k as...

Define the global error at step k as. . .

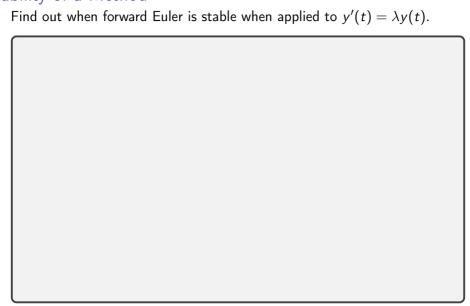

About Local and Global Error

s global error $=\sum$ local errors?	
A time integrator is said to be accurate of order p if	

ODE IVP Solvers: Order of Accuracy

A time integrator is said to be accurate of order p if $\ell_k = O(h^{p+1})$
This requirement is one order higher than one might expect—why?

Stability of a Method

Stability: Systems

What about stability for systems, i.e.

$$\mathbf{y}'(t) = A\mathbf{y}(t)$$
?

Stability: Nonlinear ODEs

What about stability for nonlinear systems, i.e.

$$\mathbf{y}'(t) = \mathbf{f}(\mathbf{y}(t))$$
?

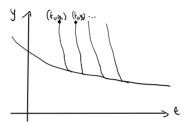

Stability for Backward Euler

Find out when backward Euler is stable when applied to $y'(t) = \lambda y(t)$.

Stiff ODEs: Demo

Demo: Stiffness [cleared]

'Stiff' ODEs

- Stiff problems have multiple time scales.
 (In the example above: Fast decay, slow evolution.)
- ▶ In the case of a stable ODE system

$$\mathbf{y}'(t) = \mathbf{f}(\mathbf{y}(t)),$$

stiffness can arise if J_f has eigenvalues of very different magnitude.

Stiffness: Observations

Why not just 'small' or 'large' magnitude?
What is the problem with applying explicit methods to stiff problems?

Stiffness vs. Methods

Phrase this as a conflict between accuracy and stability.		
Can an implicit method take arbitrarily large time steps?		

Predictor-Corrector Methods

ldea: Obtain intermediate result, improve it (with same or different method).

dea: Com	pute interme	ediate 'stage	e values', con	npute new st	ate from the
Can summ	arize in a <i>B</i>	utchar table	24.		
	anze III a Di	uttrier table	-au. 		

Runge-Kutta: Properties When is an RK method explicit?

When is an RK method explicit?
When is it implicit?
When is it diagonally implicit? (And what does that mean?)

Runge-Kutta: Embedded Pairs How can error in RK integration be controlled?

Heun and Butcher

Stuff Heun's method into a Butcher tableau:

$$1. \ \tilde{y}_{k+1} = y_k + hf(y_k)$$

2.
$$y_{k+1} = y_k + \frac{h}{2}(f(y_k) + f(\tilde{y}_{k+1})).$$

RK4

What is RK4?				

Demo: Dissipation in Runge-Kutta Methods [cleared]

Multi-step/Single-stage/Adams Methods/Backward Differencing Formulas (BDFs)

Idea: Instead of computing stage values, use <i>history</i> (of either values of f or y -or both):
Method relies on existence of history. What if there isn't any? (Such as at the start of time integration?)

Stability Regions

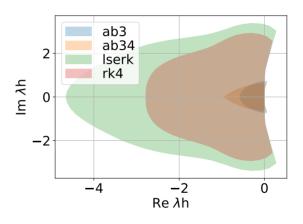

Demo: Stability regions [cleared]

Why does the idea of stability regions still apply to more complex time integrators (e.g. RK?)

More Advanced Methods

Discuss:

- What is a good cost metric for time integrators?
- ► AB3 vs RK4
- Runge-Kutta-Chebyshev
- ► LSERK and AB34
- ► IMEX and multi-rate
- ► Parallel-in-time ("Parareal")

In-Class Activity: Initial Value Problems

In-class activity: Initial Value Problems

Outline

Boundary Value Problems for ODEs Existence, Uniqueness, Conditioning Numerical Methods

BVP Problem Setup: Second Order

Example: Second-order linear ODE

$$u''(x) + p(x)u'(x) + q(x)u(x) = r(x)$$

with boundary conditions ('BCs') at a:

- ightharpoonup Dirichlet $u(a) = u_a$
- ightharpoonup or Neumann $u'(a) = v_a$
- ightharpoonup or Robin $\alpha u(a) + \beta u'(a) = w_a$

and the same choices for the BC at b.

Note: BVPs in time are rare in applications, hence x (not t) is typically used for the independent variable.

BVP Problem Setup: General Case

ODE:

$$\mathbf{y}'(\mathbf{x}) = \mathbf{f}(\mathbf{y}(\mathbf{x})) \quad \mathbf{f}: \mathbb{R}^n \to \mathbb{R}^n$$

BCs:

$$\mathbf{g}(\mathbf{y}(a),\mathbf{y}(b)) = 0 \quad \mathbf{g}: \mathbb{R}^{2n} \to \mathbb{R}^n$$

(Recall the rewriting procedure to first-order for any-order ODEs.)

Does a first-order, scalar BVP make sense?

Example: Linear BCs $B_a \mathbf{y}(a) + B_b \mathbf{y}(b) = \mathbf{c}$.

Is this Dirichlet/Neumann/...?

Do solutions even exist? How sensitive are they?

General case is harder than root finding, and we couldn't say much there.

 \rightarrow Only consider linear BVP.

(*)
$$\begin{cases} \mathbf{y}'(x) = A(x)\mathbf{y}(x) + \mathbf{b}(x) \\ B_a\mathbf{y}(a) + B_b\mathbf{y}(b) = \mathbf{c} \end{cases}$$

Exploit linearity: split into multiple problems.

Solving the "Boundary" BVP

$$(B) \begin{cases} \mathbf{y}_B'(x) = A(x)\mathbf{y}_B(x) \\ B_a\mathbf{y}_B(a) + B_b\mathbf{y}_B(b) = \mathbf{c} \end{cases}$$

Solving the "Volume" BVP

$$(V) \begin{cases} \mathbf{y}_{V}'(x) = A(x)\mathbf{y}_{V}(x) + \mathbf{b}(x) \\ B_{a}\mathbf{y}_{V}(a) + B_{b}\mathbf{y}_{V}(b) = 0 \end{cases}$$

ODE Systems: Conditioning

Altogether:

$$\mathbf{y}(x) = \mathbf{y}_B + \mathbf{y}_V = \Phi(x)\mathbf{c} + \int_a^b G(x,y)\mathbf{b}(y)dy.$$

For perturbed problem with $\boldsymbol{b}(x) + \Delta \boldsymbol{b}(x)$ and $\boldsymbol{c} + \Delta \boldsymbol{c}$, derive a bound on $\|\Delta \boldsymbol{y}\|_{\infty}$.

Shooting Method

Idea: Want to make use of the fact that we can already solve IVPs. Problem: Don't know <i>all</i> left BCs.
Demo: Shooting method [cleared]
What about systems?
What are some downsides of this method?
What's an alternative approach?

Finite Difference Method

Idea: Replace u' and u'' with finite differences.

For example: second-order centered

$$u'(x) = \frac{u(x+h) - u(x-h)}{2h} + O(h^2)$$

$$u''(x) = \frac{u(x+h) - 2u(x) + u(x-h)}{h^2} + O(h^2)$$

Demo: Finite differences [cleared]

What happens for a nonlinear ODE?

Demo: Sparse matrices [cleared]

Collocation Method

$$(*) \begin{cases} y'(x) = f(y(x), \\ g(y(a), y(b)) = 0. \end{cases}$$

1. Pick a basis (for example: Chebyshev polynomials)

$$\hat{y}(x) = \sum_{i=1}^{n} \alpha_i T_i(x)$$

Want \hat{y} to be close to solution y. So: plug into (*).

Problem: \hat{y} won't satisfy the ODE at all points at least. We do not have enough unknowns for that.

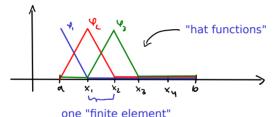

- 2. Idea: Pick n points where we would like (*) to be satisfied.
 - \rightarrow Get a big (non-)linear system
- 3. Solve that $(LU/Newton) \rightarrow done$.

Galerkin/Finite Element Method

$$u''(x) = f(x),$$
 $u(a) = u(b) = 0.$

Problem with collocation: Big dense matrix.

Idea: Use piecewise basis. Maybe it'll be sparse.

What's the problem with that?

Weak solutions/Weighted Residual Method Idea: Enforce a 'weaker' version of the ODE.

Galerkin: Choices in Weak Solutions

Make some choices:

- ▶ Solve for $u \in \text{span } \{\text{hat functions } \varphi_i\}$
- ▶ Choose $\psi \in W = \text{span } \{ \text{hat functions } \varphi_i \} \text{ with } \psi(a) = \psi(b) = 0.$
 - \rightarrow Kills boundary term $[u'(x)\psi(x)]_a^b$.

These choices are called the Galerkin method. Also works with other bases.

Discrete Galerkin

Assemble a matrix for the Galerkin method.

Remark: Both PDEs and Large Scale Linear Algebra are big topics. Will only scratch the surface here. Want to know more?

- ► CS555 → Numerical Methods for PDEs
- ► CS556 → Iterative and Multigrid Methods
- ► CS554 → Parallel Numerical Algorithms

We would love to see you there! :)

Solving Sparse Linear Systems

Solving Ax = b has been our bread and butter.

Typical approach: Use factorization (like LU or Cholesky) Why is this problematic?

Idea: Don't factorize, iterate.

Demo: Sparse Matrix Factorizations and "Fill-In" [cleared]

'Stationary' Iterative Methods

Idea: Invert only part of the matrix in each iteration. Split

$$A = M - N$$

where M is the part that we are actually inverting. Convergence?

$$Ax = b$$

$$Mx = Nx + b$$

$$Mx_{k+1} = Nx_k + b$$

$$x_{k+1} = M^{-1}(Nx_k + b)$$

- ► These methods are called *stationary* because they do the same thing in every iteration.
- ► They carry out fixed point iteration. → Converge if contractive, i.e. $\rho(M^{-1}N) < 1$.
- ► Choose *M* so that it's easy to invert.

Choices in Stationary Iterative Methods

What could we choose for M (so that it's easy to invert)?

Name	M	N		
Jacobi	D	$\overline{-(L+U)}$		
Gauss-Seidel	D+L	-U		
SOR	$\frac{1}{\omega}D + L$	$(\frac{1}{U} - 1) D - U$		
SOR $\left(\frac{1}{\omega}D + L\right)\left(\frac{1}{\omega} - 1\right)D - U$ where L is the below-diagonal part of A , and U the above-diagonal.				

Demo: Stationary Methods [cleared]

Conjugate Gradient Method

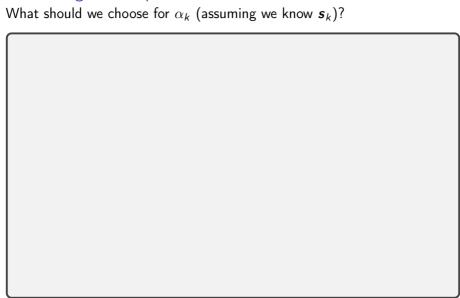

Assume *A* is symmetric positive definite.

Idea: View solving Ax = b as an optimization problem.

Use an iterative procedure (s_k is the search direction):

$$egin{array}{lll} m{x}_0 &=& \langle ext{starting vector}
angle \ m{x}_{k+1} &=& m{x}_k + lpha_k m{s}_k, \end{array}$$

CG: Choosing the Step Size

CG: Choosing the Search Direction What should we choose for s_k ?

Introduction

Notation:

$$\frac{\partial}{\partial x}u = \partial_x u = u_x.$$

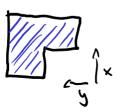

A *PDE* (partial differential equation) is an equation with multiple partial derivatives:

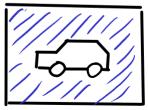

$$u_{xx} + u_{yy} = 0$$

Here: solution is a function u(x, y) of two variables.

Examples: Wave propagation, fluid flow, heat diffusion

► Typical: Solve on domain with complicated geometry.

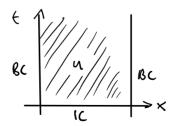

Initial and Boundary Conditions

- ► Sometimes one variable is time-like.
 What makes a variable time-like?
 - Causality
 - No geometry

Have:

- ▶ PDE
- Boundary conditions
- ► Initial conditions (in t)

Time-Dependent PDEs

Time-dependent PDEs give rise to a steady-state PDE:

$$u_t = f(u_x, u_y, u_{xx}, u_{yy}) \rightarrow 0 = f(u_x, u_y, u_{xx}, u_{yy})$$

Idea for time-dep problems (Method of Lines):

- Discretize spatial derivatives first
- ► Obtain large (semidiscrete) system of ODEs
- Use ODE solver from Chapter 9

Demo: Time-dependent PDEs [cleared]

Notation: Laplacian

Laplacian (dimension-independent)

$$\Delta u = \operatorname{\mathsf{div}}\operatorname{\mathsf{grad}} u =
abla \cdot (
abla u) = u_{\mathsf{xx}} + u_{\mathsf{yy}}$$

Classifying PDEs

Three main types of PDEs:

- hyperbolic (wave-like, conserve energy)
 - first-order conservation laws: $u_t + f(u)_x = 0$
 - ightharpoonup second-order wave equation: $u_{tt} = \Delta u$
- parabolic (heat-like, dissipate energy)
 - ▶ heat equation: $u_t = \Delta u$
- elliptic (steady-state, of heat and wave eq. for example)
 - ▶ Laplace equation $\Delta u = 0$
 - Poisson equation $\Delta u = f$ (Pure BVP, similar to 1D BVPs, same methods apply–FD, Galerkin, etc.)
